V1- Reading Comprehension& Summary Making (40 Marks)

Read the following passage carefully, then answer the questions below:

Penicillin announced the beginning of the antibiotic age. Before its introduction there was no effective treatment for infections. Hospitals were full of people with blood poisoning suffered from a cut or a scratch, and doctors could do little for them but wait and hope. The story of Penicillin began when the First World War of 1914-1918 broke out; a person called Fleming became an army doctor and carried on his work in France. When a soldier is wounded in a battle, it usually happens that a piece of his dirty clothing is carried deep into the wound by the bullet. The wound becomes bad or infected and disease spreads through the body. Sometimes an arm or a leg has to be cut off or the man would die, not from the wound but from the poison in **his** body.

Fleming has already known that microbes caused a disease of this kind. It might be possible to kill them by washing the wound in an acid, called antiseptic; this was always done, but the soldiers still died in great numbers. After the war, Fleming went on working for years, trying to find an antiseptic which would stop microbes from growing; but which would not harm the blood cells, so that the body could carry on its own fight against disease.

One day he stopped to examine the glass dishes on which he had grown some microbes in a special liquid. In one dish, he was surprised to notice a greenish mould. That meant a tiny seed, too small to see, must have floated on the dish when the lid was off. Fleming took a closer look and then made a careful examination. He saw that a strange thing had happened. Where the greenish mould was growing, the disease microbes had disappeared. He began to grow enough of the mould to make from it a clear liquid, which tests showed could kill microbes or stop them in both animals and human beings without harming their white blood cells. He called the liquid penicillin.

Penicillin has affected the lives of everyone. The story of its development from a chance observation in 1928 by Alexander Fleming to a life-saving drug is exciting. It **revolutionized** healthcare and turned the modest Fleming into a world hero.
